DATE MAILED: 02/08/2006

Please find below and/or attached an Office communication concerning this application or proceeding.

**Office Action Summary**

Application No.

10/718,269

Applicant(s)

RENKEN ET AL.

Examiner

Jermele M. Hollington

Art Unit

2829

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1) ☒ Responsive to communication(s) filed on 06 November 2005.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 4) ☒ Claim(s) 1-53 is/are pending in the application.
- 4a) Of the above claim(s) 17-44 is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-3, 9-14, 45, 46 and 49-53 is/are rejected.
- 7) ☒ Claim(s) 4-8, 15, 47 and 48 is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

**Priority under 35 U.S.C. § 119**

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

## DETAILED ACTION

### *Response to Arguments*

1. Applicant's arguments filed Nov. 16, 2005 have been fully considered but they are not persuasive.

In regarding claims 1 and 11, the applicants state: "...*Claim 1 recites, "electronics module that communicates with the first portion, the electronics module attached to the substrate carrier." No such electronics module appears to be shown by the cited references. "Robot 3" of Seita was cited as showing this feature. However, element 3 does not appear to be a robot or an electronics module. "Reference numeral 3 designates a robot flange." Column 5, line 8 (emphasis added). Also, robot flange 3 does not appear to be in communication with the first portion. Robot flange 3 appears to be a feature provided for a robot to handle wafer carrier 100.*"

In response to the above argument, in the MPEP it states "Office personnel are to give claims their broadest reasonable interpretation in light of the supporting disclosure." In re Morris, 127 F.3d 1048, 1054-55, 44 USPQ2d 1023, 1027-28 (Fed. Cir. 1997). Further it states "Limitations appearing in the specification but not recited in the claim are not read into the claim." E-Pass Techs., Inc. v. 3Com Corp., 343 F.3d 1364, 1369, 67 USPQ2d 1947, 1950 (Fed. Cir. 2003). In viewing the claim invention, the electronic module is attached to a substrate carrier and communicates with the substrate. As shown in Fig. 2, the robot flange is attached to a substrate carrier 100 and could be indirectly communicate with the substrate since the applicants do not disclose in the claim how module and the substrate is in communication.

Further regarding claim 1, the applicants' state: "*Adding a plurality of sensors to a substrate would appear contrary to this purpose. In particular, if sensors are added to a substrate, yield would appear to be lowered accordingly. MPEP 2143.01 states, "The proposed modification cannot render the prior art unsatisfactory for its intended use." Because the intended use of the apparatus of Seita is prevention of adhesion of extraneous matter to substrates, and the proposed modification would involve deliberately adhering (or otherwise attaching)*

Art Unit: 2829

*extraneous matter (sensors) to substrates, this modification would appear to make the apparatus of Seita unsatisfactory for its intended purpose."*

In response to the above argument, "The reason or motivation to modify the reference may often suggest what the inventor has done, but for a different purpose or to solve a different problem. It is not necessary that the prior art suggest the combination to achieve the same advantage or result discovered by applicant." In re Linter, 458 F.2d 1013, 173 USPQ 560 (CCPA 1972).

### ***Double Patenting***

2. Claims 1-16 are provisionally rejected under 35 U.S.C. 101 as claiming the same invention as that of claims 1-16 of copending Application No. 10/837,359. This is a provisional double patenting rejection since the conflicting claims have not in fact been patented.

### ***Claim Rejections - 35 USC § 103***

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later

Art Unit: 2829

invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

5. Claims 1-3, and 9-14 are rejected under 35 U.S.C. 103(a) as being unpatentable over Seita (6808352) in view of Smesny et al (5444637).

Regarding claim 1, Seita discloses [see Figs. 2 and 8] a sensing apparatus [see **Note** below] where a standard substrate (not numbered but shown in Fig.8) is transported in a standard substrate carrier (wafer carrier 100 of Fig. 8) that establishes a position of the standard substrate relative to a surface of the standard substrate carrier (100 of Fig. 8) and where the robot (top of carrier shell 1) of at least one processing tool is calibrated to the position of the standard substrate (shown in Fig. 8) relative to the surface of the standard substrate carrier (100 of Fig. 8), comprising: a first portion that includes: a substrate (19); a second portion that includes: a substrate carrier (100) that establishes the position of the first portion relative to a surface of the substrate carrier (100) to be the same as the position of the standard substrate (in Fig. 8) relative to the surface of the standard substrate carrier (100 of Fig. 8); an electronics module (robot 3) that communicates with the first portion, the electronics module (3) attached to the substrate carrier (100); and wherein the first portion may be moved independently of the second portion. However, he does not disclose a plurality of sensors attached to the substrate as claimed. Smesny et al disclose [see Figs. 1-2] a sensing apparatus comprising a first portion that includes: a substrate (substrate 10) and a plurality of sensors (sensors 12) attached to the substrate (10). Further, Smesny et al teach that the addition of plurality of sensors attached to the substrate is advantageous because the sensors are configured to detect processing condition by read, store and retrieve conditions registered within each region of the substrate. It would have been obvious

Art Unit: 2829

to a person having ordinary skill in the art at the time the invention was made to modify the apparatus of Seita by adding a plurality of sensors on the substrate as taught by Smesny et al in order to detect processing condition by read, store and retrieve conditions registered within each region of the substrate.

[Note: the recitation “for sensing conditions in target environments in a processing facility” has not been given patentable weight because the recitation occurs in the preamble. A preamble is generally not accorded any patentable weight where it merely recites the purpose of a process or the intended use of a structure, and where the body of the claim does not depend on the preamble for completeness but, instead, the process steps or structural limitations are able to stand alone. See *In re Hirao*, 535 F.2d 67, 190 USPQ 15 (CCPA 1976) and *Kropa v. Robie*, 187 F.2d 150, 152, 88 USPQ 478, 481 (CCPA 1951).]

Regarding claim 2, Seita discloses the substrate carrier (100) is a standard substrate carrier [see col. 5, lines 1-4].

Regarding claim 3, Seita discloses the position of the standard substrate (shown in Fig. 8) relative to the surface of the standard substrate carrier (100 of Fig. 8) is the vertical height of the standard substrate above the bottom surface of the standard substrate carrier (100 of Fig. 8).

Regarding claim 9, Seita discloses [see Fig. 5] a pattern on at least one surface of the substrate (19); and an optical reading apparatus (substrate processing systems 21) attached to the substrate carrier (100) that reads the pattern on the substrate (19) to determine the orientation of the substrate (19).

Regarding claim 10, Seita discloses the second portion further comprises an alignment module (retainer 11) that aligns the first portion relative to the substrate carrier (100).

Regarding claim 11, Seita discloses a sensing apparatus for-sensing processing conditions in a processing tool (carrier shell 1) that has a robot (OHT 20) that transfers a standard substrate

(shown in Fig. 8) between a standard substrate carrier (100 in Fig. 8) and a process chamber (substrate processing systems 21), comprising: a process condition measuring device, comprising: a substrate (substrate 19); a handling system, comprising: a substrate carrier (wafer carrier 100) that holds the process condition measuring device, the robot (OHT 20) transferring the process condition measuring device between the substrate carrier (100) and the process chamber (21), and an electronics module (3) attached to the substrate carrier (100) that communicates with the process condition measuring device while the substrate carrier (100) holds the process condition measuring device. However, he does not disclose a plurality of sensors attached to the substrate as claimed. Smesny et al disclose [see Figs. 1-2] a sensing apparatus comprising a first portion that includes: a substrate (substrate 10) and a plurality of sensors (sensors 12) attached to the substrate (10). Further, Smesny et al teach that the addition of plurality of sensors attached to the substrate is advantageous because the sensors are configured to detect processing condition by read, store and retrieve conditions registered within each region of the substrate. It would have been obvious to a person having ordinary skill in the art at the time the invention was made to modify the apparatus of Seita by adding a plurality of sensors on the substrate as taught by Smesny et al in order to detect processing condition by read, store and retrieve conditions registered within each region of the substrate.

Regarding claim 12, Seita discloses the substrate carrier (100) is a standard substrate carrier [col. 5, lines 1-4].

Regarding claim 13, Seita discloses the substrate carrier (100) is a front opening unified pod (FOUP) [col. 5, lines 1-4].

Regarding claim 14, Seita discloses the substrate carrier (100) is a wafer cassette [col. 5, lines 1-4].

*Claim Rejections - 35 USC § 102*

6. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

7. Claims 45-46, and 49-53 are rejected under 35 U.S.C. 102(b) as being anticipated by Smesny et al (5444637).

Regarding claim 45, Smesny et al disclose a two part apparatus for measuring process conditions within a process chamber, comprising: a first part that includes a plurality of sensors (sensors 12) for measuring one or more process conditions and an energy storage unit (processor with memory 20) attached to a substrate (wafer 10); a second part that includes a housing (chamber 90) for the first part, a power supply unit [see col. 12, lines 14-16] attached to the housing (90) and a communication unit (linear encoders 98) attached to the housing (90), the power supply unit providing power to the first part and the communication unit (98) providing communication between the first part and the second part; and wherein the first part is housed (90) in the second part in a first mode and is moved from the second part to the process chamber, without physical connection to the second part, in a second mode.

Regarding claim 46, Smesny et al disclose the substrate (10) is a disk with the diameter of a silicon wafer and the housing (90) is a wafer holder.

Regarding claim 49, Smesny et al disclose the communication unit (98) uses light [via photodiode sensor 106 see col. 12, lines 62-66] to communicate with the first part.

Regarding claim 50, Smesny et al disclose the housing is a Standard Mechanical Interface (SMIF) box or a Front Opening Unified POD (FOUP).

Regarding claim 51, Smesny et al disclose an apparatus for measuring conditions in a target environment, comprising: a process condition measuring device (wafer 10) that includes sensors (sensors 12) to measure one or more process conditions in the target environment, the process condition measuring device (10) further including a power supply (power supply 16) and a first induction coil; a handling system (chamber 90) including a second induction coil, the handling system (90) having a location to hold the process condition measuring device (10) near the second induction coil (electrode 94), the first and second induction coils being inductively coupled when the process condition measuring device (10) is at the location, the inductive coupling transferring both electrical power and data; and the process condition measuring device (10) being independently movable from the handling system (90) to measure process conditions.

Regarding claim 52, Smesny et al disclose power is transferred from the handling system (90) to the process condition-measuring device (10) through the inductive coupling and data is transferred from the process condition measuring device (10) to the handling system (90) through the inductive coupling.

Regarding claim 53, Smesny et al disclose data is also transferred from the handling system (90) to the process condition-measuring device (10) through the inductive coupling.

*Conclusion*

8. Claims 4-8, 15 and 47-48 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

9. The following is a statement of reasons for the indication of allowable subject matter: regarding claim 4, the primary reason for the allowance of the claim is due to a sensing apparatus comprising a receiving unit attached to the substrate that receives power from the electronics module and a transmitting unit in the electronic module that transmits power to the receiving unit. Since claims 5-7 depends off of claim 4, they also have allowable subject matter.

Regarding claim 8, the primary reason for the allowance of the claim is due to the second portion further comprises an RFID transceiver electrically connected to the electronics module so that data may be sent from the electronics module to the RFID transceiver and data may be sent from the RFID transceiver to an external receiver.

Regarding claim 15, the primary reason for the allowance of the claim is due to the process condition measuring device further includes at least one battery and other components attached to the substrate.

Regarding claim 47, the primary reason for the allowance of the claim is due to the power supply unit has an induction coil that inductively transmits power to the first part. Since claim 48 depends from claim 47, it also has allowable subject matter.

Since the examiner has not change the prior art used in the previous Office Action, the following is being applied.

10. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Jermele M. Hollington whose telephone number is (571) 272-1960. The examiner can normally be reached on M-F (9:00-4:30 EST) First Friday Off.

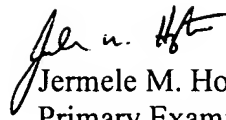

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Wael Fahmy can be reached on (517) 272-1705. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
